

TOPIC 13 — ASSESSMENT

Data Analysis Assistant GPT

Assessment Evidence & Test Results

Candidate: Shaik Mohammad Shaheed

Final Result: 4/4 required scenarios passed

1. Project Overview

A Custom GPT designed for responsible business data analysis. It uses Code Interpreter & Data Analysis when genuinely necessary, explains findings in plain language, flags data-quality issues, asks clarifying questions when requirements are unclear, and avoids unsupported or fabricated conclusions.

2. GPT Configuration

Configuration	Status
Code Interpreter & Data Analysis	Enabled
Web Search	Disabled
Image Generation	Disabled
Recommended Model	No Recommended Model
Knowledge	sample_dataset.csv; incomplete_dataset.csv
Instruction Block	Plain-language, tool governance, clarification and anti-fabrication rules

3. Test Results

Test	Scenario	Result
1	Clear analysis objective	PASS
2	Dataset without an objective	PASS
3	Incomplete / incorrect data	PASS
4	Ambiguous comparison request	PASS

Test 1 — Clear Objective

The GPT analyzed the 9-record sales dataset, calculated metrics, identified monthly/product/regional patterns, explained them in plain language, and disclosed the small-sample limitation.

Test 2 — No Objective

When asked only to analyze the uploaded dataset, the GPT stopped and asked what the user wanted analyzed instead of selecting an objective itself.

Test 3 — Incomplete / Incorrect Data

The GPT identified missing Units_Sold, missing Revenue, a negative Units_Sold value, and a suspicious revenue-to-units combination. It explained the potential impact and did not silently correct the data.

Test 4 — Ambiguous Comparison

When asked which region was better, the GPT asked which metric should be used—such as total revenue, units sold, profit, or growth rate—before comparing regions.

4. Challenges and Resolutions

Challenge	Resolution
No-objective request triggered analysis.	Added a mandatory Objective Gate requiring clarification before analysis.
Ambiguous comparison triggered an assumed metric.	Added a Critical Ambiguous Comparison Gate requiring an explicit evaluation metric.
Incomplete data could produce misleading results.	Added data-quality checks and instructions to flag missing/invalid values before relying

5. Deliverables

- Working Custom GPT: Data Analysis Assistant
- sample_dataset.csv
- incomplete_dataset.csv
- instruction_block.md
- test_results.md
- Loom demonstration

6. Links

GPT: <https://chatgpt.com/g/g-6ab8a393af6881919d925e73dd5538a0-data-analysis-assistant>

Loom: <https://www.loom.com/share/a67d31423a9c434891bcb540e3deb704>

7. Assumptions

- The sample dataset is for demonstration and assessment testing.
- A negative Units_Sold value may represent an invalid entry or a legitimate return/cancellation; the GPT should request clarification rather than decide silently.
- The small sample should be treated as a descriptive snapshot, not evidence of long-term business performance.

FINAL RESULT: 4/4 PASS
